

Homework: xx

Name: Satish kumar Oran

RollNo:

Collaborators Names: Md Arsad , Raunak kumar

our project is Medical App

in this project we made 5n file :-

dataset.csv , medical_using_sklearn.py , README.md symp-
tom_Description.csv , symptom_precaution.csv , symp-
tom_severity.csv

in medical_using_sklearn.py contain python code first of
all Member1 created a git repository and a main branch
on github after creating git repository Member1 added
other group member as collaboratorhttps then pulled that
git rpository in local machine by using the command **git
clone https://github.com/joint-operation/web-app.git**
member1 created all the required file on main branch and
then push it on the github by using command **git push**
there was found an error that it was not been traced so
for fixing this error we run the command **git remote add
origin https://github.com/joint-operation/web-app.git**
after that run **git push** command

after that every every member pull that repository from Github and created their own branch name as Member1 ,Member2 and Member3 and we all were working on that file indivisually every member added and committed on their own branch and push their content on their branch after that moved to main branch and and merge their branch to main branch using command

git merge branch_name

since we have not worked parallaly so we have not found conflict error.

when we run the **git log** commnad we see our commit history
